### The Childhood Liver Disease Research and Education Network (CHILDREN)

The Children's study provides a prospective database, linked to tissue banked after surgery, for children with biliary atresia. The purpose of the database is to determine predictors of outcome. In addition, children with biliary atresia are enrolled in a prospective randomized trial of steroids after hepatoporoenterostomy to determine if the use of steroids improves outcome.

### Adolescent Bariatrics: Controlled Longitudinal Study of Psychosocial Development (TeenView)

The major goals of this study are to describe the psychosocial health and quality of life of obese adolescents and their families and to determine if bariatric surgery has a positive affect on psychosocial health over time, compared to patients whose treatments include non-surgical weight management.

### Dietary Intake and Eating Behavior in Adolescents who Undergo Bariatric Surgery (Teen Intake)

The major goals of this study are to examine the changes in dietary intake and psychosocial health of obese adolescents who undergo bariatric surgery, to determine how patients' post-surgical eating patterns change, compared to patients whose treatments include non-surgical weight management.

### Biliary Atresia Clinical Research Consortium (BARC/CHILDREN)

The Children's study provides a prospective database, linked to tissue banked after surgery, for children with biliary atresia. The purpose of the database is to determine predictors of outcome. In addition, children with biliary atresia are enrolled in a prospective randomized trial of steroids after hepatoporoenterostomy to determine if the use of steroids improves outcome.
