MCPAP for Moms:
A Primer for Massachusetts Pediatric Providers

Version 3 for Massachusetts Providers
April 1, 2018
MCPAP for Moms aims to improve outcomes for babies, children, and families by helping pregnant and postpartum women access and engage in depression treatment.

Pediatric providers in Massachusetts are well acquainted with the Massachusetts Child Psychiatry Access Program (MCPAP), created in 2004 as a statewide response to the widespread lack of access to child psychiatry. MCPAP is broadly recognized as enhancing the capacity of pediatric primary care providers to treat children and adolescents with behavioral health issues.

In 2014, MCPAP launched a new program, MCPAP for Moms, to promote maternal and child health by building the capacity of providers serving pregnant and postpartum women and their children up to one year after delivery to effectively prevent, identify, and manage depression. MCPAP for Moms aims to help pediatric providers screen mothers and fathers for postpartum depression within the context of well-child care.

MCPAP for Moms aims to:

- Implement universal screening for depression during pregnancy and postpartum for the approximately 72,000 women who deliver babies in Massachusetts each year;
- Increase access to mental health care among pregnant and postpartum women; and
- Improve mental health outcomes for mothers and fathers, and thereby improve outcomes for babies and families.

MCPAP for Moms Pediatric Toolkit

The MCPAP for Moms Pediatric Toolkit provides information to support pediatric providers as they detect and screen for mental health concerns. We recommend pediatric providers review the toolkit. The complete MCPAP for Moms Pediatric Toolkit can be found at www.mcpapformoms.org under “Provider Toolkit/MCPAP for Moms toolkit – Massachusetts Pediatric Provider.”

The MCPAP for Mom Toolkit includes:

1. This primer
2. Assessment Tools: Highlights the range of depression and mental health concerns that may occur postpartum, possible treatment options, and key issues to consider when assessing mental health status during the postpartum period
   a. Key Clinical Considerations When Assessing the Mental Health of Pregnant and Postpartum Women: Provides key information/concepts to consider when assessing the mental health of pregnant and postpartum women
   b. Summary of Emotional Complications During Pregnancy and the Postpartum Period: An overview of the range of emotional complications that can occur during pregnancy and postpartum including Baby Blues, Perinatal Depression, Perinatal Anxiety, Posttraumatic Disorder (PTSD), Obsessive- Compulsive Disorder (OCD), and Postpartum Psychosis
3. Screening Tools and Algorithms: Includes depression screens and a depression screening algorithm designed for pediatric providers
   a. Edinburgh Postnatal Depression Scale (EPDS) as part of SWYC or standalone
b. **Postpartum Depression Screening Algorithm for Pediatric Providers during Well-Child Visits**: Provides guidance on administering the EPDS or PHQ-9 and next steps depending on score. Side one is a simplified version of the algorithm. Side two provides more detailed information including talking points and suggested language regarding how to discuss the screen and resultant scores with a parent.

**Why is postpartum depression important to pediatric providers?**

*Postpartum depression (PPD) is a widespread problem that can complicate birth, infant, and child outcomes.*

**Prevalence and risk factors**
Perinatal depression - depression before, during, and in the year following pregnancy - can have far-reaching, harmful effects for all family members. One in five women screens positive for depression during her first postpartum year. One in three fathers in families struggling with maternal depression experience PPD. Depression in fathers may present differently than in mothers. Men with depression are more likely to report substance abuse and disturbances in work and social functioning. Adoptive parents have similar rates of depression as birth parents during the postpartum period. Individuals with a family history of depression, substance use disorders, or a personal history of depression are at increased risk for perinatal depression. Large health disparities in the U.S. place low-income and racial and ethnic minority families at increased risk for parental depression, stress, and poorer child outcomes compared to affluent families.

**Impact on birth outcomes**
Birth outcomes can be adversely affected by depression in pregnancy and PPD can have a long-term impact on child outcomes. PPD is associated with attachment insecurity, difficult infant/childhood temperament, developmental delay, and impaired language development. Treatment of maternal depression until remission is associated with decreased psychiatric symptoms and improved functioning outcomes among offspring. Despite the profound, negative effects on mother and child, some of which improve with depression treatment, the vast majority of women with PPD go untreated.

**What is known about PPD screening in pediatric settings?**
Most perinatal or obstetrical settings only see postpartum women and screen for PPD at the 4-6 week postpartum visit. Significant numbers of women do not keep their postpartum visits. Pediatric providers caring for children under the age of five may be the only medical provider many mothers see during the child’s first year of life. Pediatric providers see mothers frequently and may get to know them better than their own obstetric or primary care provider. Since PPD can be identified in pediatric settings, training pediatric providers to detect and address PPD during the first postpartum year can enhance providers’ impact on maternal mental health, carrying the potential to have a trans-generational impact.

**How does MCPAP for Moms help pediatric providers and practices?**
MCPAP for Moms can help pediatric providers in two distinct ways. MCPAP for Moms provides real-time psychiatric consultation and care coordination for pediatric providers as they provide well-care to infants and their families and when they need support around perinatal mental health concerns as they care for pregnant and postpartum teenagers.
MCPAP for Moms encourages all pediatric providers to screen for postpartum depression in:
- mothers and fathers of infant patients during well-child visits; and
- pregnant or postpartum women receiving primary care from a pediatric provider.

**What screening instrument should I use for PPD screening during the infant’s well-visit?**
The preferred screening instrument is the Survey of Wellbeing of Young Children (SWYC), available on the SWYC website at [https://www.floatinghospital.org/The-Survey-of-Wellbeing-of-Young-Children/Overview.aspx](https://www.floatinghospital.org/The-Survey-of-Wellbeing-of-Young-Children/Overview.aspx). The developers of the SWYC have created an augmented version of the SWYC screening tool because maternal mental health is critical to the development and well-being of infants and young children. Choose the 2-, 4-, or 6-month version depending on the age of the infant. Embedded in the SWYC is the Edinburgh Postnatal Depression Scale (EPDS), a widely used and validated 10-item questionnaire to identify women experiencing depression during pregnancy and the postpartum period. The rest of the SWYC at these three ages is identical to the generic SWYC. The SWYC is a comprehensive screening instrument used to assess children's cognitive, language, motor, and social-emotional development as well as family risk factors (parental depression, conflict, substance abuse, and hunger). It is short and easy to score. Instructions for scoring the SWYC are also available on the SWYC website.

Another instrument that can be used to screen for PPD is the Patient Health Questionnaire (PHQ-9). The PHQ-9 ([http://www.phqscreeners.com](http://www.phqscreeners.com)) is a validated questionnaire to identify depression during pregnancy and the postpartum period. The EPDS can also be used as a standalone instrument with instructions in Appendix 3.

**Can I bill for PPD screening?**
In Massachusetts, if you use the SWYC that includes the EPDS PPD screen or the standalone EPDS, you can bill under the child’s insurance using the developmental-behavioral procedure code 96110. The SWYC and the EPDS are approved by MassHealth for compliance with MassHealth’s behavioral health screening requirement under the Children’s Behavioral Health Initiative (CBHI). For MassHealth, add the modifier UD to indicate a PPD screen was done. See [http://www.mass.gov/eohhs/docs/masshealth/transletters-2017/all-219.pdf](http://www.mass.gov/eohhs/docs/masshealth/transletters-2017/all-219.pdf).

**When an infant is the patient**
Well-child visits provide an ideal opportunity to detect and address PPD. As pediatric providers are most often not providing primary care to mothers, their main role is one of screening and referral. PPD screening is recommended for mothers and fathers as part of well-child visits (and at other times if indicated) at the following ages:
- Within first month
- 2-month visit
- 4-month visit
- 6-month visit

MCPAP for Moms provides a [Depression Screening Algorithm for Pediatric Providers During Well-Child Visits](https://www.floatinghospital.org/The-Survey-of-Wellbeing-of-Young-Children/Overview.aspx) (see Appendix), which offers step-by-step guidelines for administering and responding to a PPD screen. While the majority of mothers and fathers will not screen positive for PPD, the postpartum period can be challenging, and depression and other mental health concerns can arise at any time.
The baby’s behavior offers a window into the emotional state of the family. Problems of crying, sleep, and feeding are intimately intertwined with perinatal emotional complications, both as cause and result. Parents’ mood affects the baby, and baby’s mood affects the parents. Time spent in the primary care setting addressing these issues in the context of evaluating the parents’ emotional wellbeing can be a first step in treatment.

For all parents with a positive screen, first determine risk: (Practices with a co-located behavioral health clinician may want to use their clinician for this task.)

1. If there is a crisis or safety concern or the parent gave a positive response on the EPDS or PHQ-9 self-harm question, refer to the parent’s local mental health emergency service or emergency room. For MassHealth Members, contact the local Emergency Services Program (ESP) at 1-877-3821609. Parents should not be left alone, and someone should accompany parents to emergency services.

2. If the parent is not in need of emergency evaluation and is already in mental health treatment or has access to a mental health provider (e.g., someone they have used in the past), refer to and with parent’s consent notify that mental health provider.

3. If the parent is not in need of emergency evaluation and if the parent does not already have a mental health provider:
   a. Refer the parent to a community mental health provider and give the parent information about community resources such as support groups. Refer them to the MCPAP for Moms website (www.mcpapformoms.org) to find resources. You can order MCPAP for Moms resource cards from your local MCPAP team.
   b. You may call MCPAP for Moms (1-866-666-6272) to get the names of local community mental health providers who serve patients with PPD. When you call, we suggest that you have the parent’s insurance so that the MCPAP for Moms care coordinator can match resources to the appropriate insurance plan.
   c. Refer and with consent notify the parent’s PCP and/or OB/GYN for monitoring and follow-up. You may recommend that the PCP or OB/GYN call MCPAP for Moms if he or she has clinical questions.

4. If you are concerned about the parent keeping the referral, consider calling in a week to verify that the parent followed through. If your practice has a care coordinator, follow up should be a routine part of your practice work flow.

5. Engage natural supports and encourage parent to utilize them. Most likely you will have only one parent in the office when a PPD screen is positive. A depressed parent who is alone or feeling alone is at higher risk for suicide. It is important for someone else in the parent’s life to be aware of the presence of depression and be able to step in to help. With the parent’s consent, notify natural supports. This is an excellent time to screen for domestic violence to ensure that the natural support is appropriate.

6. Remember that you can always call MCPAP for Moms if you are worried about what to do.

Just as many pediatric providers have become comfortable with managing uncomplicated ADHD, depression, and anxiety with the help of MCPAP for Moms, we hope that obstetric and adult PCPs will become comfortable managing PPD. Therefore, we recommend that pediatric providers and their office staff refer parents to an adult provider such as their PCP or OB/GYN. If there are difficulties referring women to their PCP or OB/GYN, pediatric providers may call MCPAP for Moms for assistance in identifying mental health providers in the parent’s community.
MCPAP for Moms recommends that pediatric providers document the screening result and your planned action in the medical record as you would with other risk factors that may affect the infant’s health such as substance use disorders or domestic violence. Follow your organization’s policy about screening tools as to whether or not to scan in the actual SWYC or EPDS screening form. MCPAP for Moms recommends that pediatric practices continue to use their current strategies for appropriately documenting potentially sensitive family information, especially when there are custody concerns.

When a pregnant/postpartum young mother is the patient
MCPAP for Moms recommends that pediatric providers caring for pregnant teens or postpartum young mothers screen for depression during pregnancy and in the postpartum period. New mothers should also be screened for PPD during well-child visits. If you decide to treat a teen with depression during the perinatal period, you may find the adult MCPAP for Moms toolkit helpful at https://www.mcpapformoms.org/Toolkits/Toolkit.aspx. Call MCPAP for Moms (1-866-666-6272) if you need assistance.

Antidepressant medications and lactation
Considerations for lactating women:
1. SSRIs (and some other antidepressants) are considered a reasonable treatment option during breastfeeding of healthy infants. In premature or ill infants, the safety is less clear.
2. When antidepressants are indicated, the benefits of breastfeeding a healthy infant while taking antidepressants generally outweigh the risks.
3. Most psychiatric medications are passed into breast milk, though in very low amounts.
4. The benefits of other psychiatric medications, including benzodiazepines, antiepileptics, stimulants, and antipsychotics may outweigh the risks of the medication during breastfeeding. It is important to take into consideration the infant’s health as a factor when weighing the risks and benefits of the medication to mother and infant. Each class of psychiatric medications carries a different risk, and decisions should be made on a patient-by-patient basis and consider the needs of the family.
5. It is important to consider the risk of untreated illness to the mother-baby dyad, as well as the entire family, and balance this with the risk of medication use during breastfeeding.
6. It is crucial that evaluation of the risks and benefits of medication use during breastfeeding is done on a patient-by-patient basis and considers the needs of the family.
7. Recommendations are ideally made collaboratively with well-informed patients and family members.
8. Monitor for medication side effects in nursing infants.

We also recommend the NIH website LactMed, that contains information on medications to which breastfeeding mothers may exposed. Providers can also download the LactMed app for mobile devices. We encourage providers to call MCPAP for Moms for any questions regarding the use of antidepressants or other psychiatric medications during breastfeeding. Pediatric providers can also visit the MCPAP for Moms website for additional information and treatment algorithms.

Community Resources – MCPAP for Moms Partner

Key to the success of MCPAP for Moms is its partnership with William James College Interface Referral Service to help facilitate linkages to resources including mental health care, support groups,
and other activities to support the wellness and mental health of pregnant and postpartum women. William James College Interface Referral Service works with MCPAP for Moms to collect and categorize resources specifically related to perinatal mental health and wellness. These resources are utilized and updated daily and accessed by the MCPAP for Moms care coordinators as they refer and coordinate mental health care for parents needing services. Support group resources can be found on the MCPAP for Moms website under the “For Mothers and Families” tab.

**Home Visiting Programs**

Massachusetts home visiting programs offer voluntary, family focused services to expecting or new families with infants and children. Services are predominately provided in a family’s home. Many home-visiting programs offer group-based services as well. Home visits are provided in a routine and sustained manner, ranging from a weekly to a monthly basis. Typically, families are eligible to remain in home-visiting programs for three to five years, although this varies by individual program. Home-visiting services are delivered by trained home-visiting professionals or paraprofessionals, with the goal of addressing specific issues based upon the family’s eligibility for the program. While each home visiting program has different eligibility criteria—and thus delivers different services to their participants—there are many elements that are consistent across programs. The common core elements of most home visiting programs include, but are not limited to: addressing mother and child health, safety, and mental health; positive parenting; child development and school readiness; and injury prevention including safe homes. These programs also introduce parents to education and employment opportunities.

The home visitor works collaboratively with the family to set family goals, provide screenings, assessments, and parenting information, make referrals on behalf of families, and connect families to any other community-based resources as needed. The following are some of the outcomes that home visiting programs across the country have demonstrated:

- Increased rates of teen moms staying in school and graduating
- Increased access to primary care medical services for the child
- Increased child immunization rates
- Improved parent-child bonding
- Improved school readiness
- Decreased number of low-birth weight babies
- Decreased number of child abuse and neglect cases
- Decreased families’ need for welfare, or TANF (Temporary Assistance to Needy Families) and other social services

For home visiting resources please see the For Mothers and Families tab, Resources for Pregnant and Postpartum Women on the MCPAP for Moms website.

**MCPAP for Moms Web-Based Resources for Pediatric Providers**

There are many web-based resources available to support pediatric providers and their patients and families. The MCPAP for Moms website (www.mcpapformoms.org) provides detailed information about how MCPAP for Moms works, FAQs, and online resources to assist providers on various issues specific to PPD including evidence-based approaches and medication decision-making.
1. **Provider Toolkit/MCPAP for Moms Toolkit – Pediatric Providers**: Provides all the assessment tools, screening tools, and algorithms that make up the Pediatric Provider Toolkit. All tools are available for download.

2. **Provider Toolkit/MCPAP for Moms Toolkit – Adult Providers**: Provides additional information about the delivery of treatment, including information about medication and lactation, and services to parents experiencing PPD and other mental health concerns by adult primary care providers.

3. **For Mothers and Families**: General information pertaining to PPD as well as in-person, online, and telephone support options for mothers and fathers
   a. **Talking to Your Provider about Perinatal Mental Health Concerns**: Provides guidance for parents talking with providers about their mental health concerns.
   b. **How to Find a PCP**: Provides step-by-step instructions to help parents find and choose a PCP.

### Risk Factors for Postpartum Depression

| • Personal history of major or postpartum depression | • Complications of pregnancy, labor/delivery, or infant’s health |
| • Family history of postpartum depression | • Teen pregnancy |
| • Gestational diabetes | • Unplanned pregnancy |
| • Difficulty breastfeeding | • Major life stressors |
| • Fetal/newborn loss | • Violent or abusive relationship |
| • Lack of personal or community resources | • Isolation from family or friends |
| • Financial challenges | |
| • Substance use/addiction | |

### How to Talk about Perinatal Depression with Moms

1. *How are you feeling about being pregnant/a mother?*
2. *What things are you most happy about?*
3. *What things are you most concerned about?*
4. *Do you have anyone you can talk to that you trust?*
5. *How is your partner doing?*
6. *Are you able to enjoy your baby?*

Edinburgh Postnatal Depression Scale\(^1\) (EPDS)

Name: ______________________________       Address: ___________________________

Your Date of Birth: ____________________       ___________________________

Baby’s Date of Birth: ___________________       Phone: ___________________________

As you are pregnant or have recently had a baby, we would like to know how you are feeling. Please check the answer that comes closest to how you have felt IN THE PAST 7 DAYS, not just how you feel today.

Here is an example, already completed.

I have felt happy:
☐ Yes, all the time
☐ Yes, most of the time  This would mean: “I have felt happy most of the time” during the past week.
☐ No, not very often  Please complete the other questions in the same way.
☐ No, not at all

In the past 7 days:

1. I have been able to laugh and see the funny side of things
   ☐ As much as I always could
   ☐ Not quite so much now
   ☐ Definitely not so much now
   ☐ Not at all

2. I have looked forward with enjoyment to things
   ☐ As much as I ever did
   ☐ Rather less than I used to
   ☐ Definitely less than I used to
   ☐ Hardly at all

3. I have blamed myself unnecessarily when things went wrong
   ☐ Yes, most of the time
   ☐ Yes, some of the time
   ☐ Not very often
   ☐ No, never

4. I have been anxious or worried for no good reason
   ☐ No, not at all
   ☐ Hardly ever
   ☐ Yes, sometimes
   ☐ Yes, very often

5. I have felt scared or panicky for no very good reason
   ☐ Yes, quite a lot
   ☐ Yes, sometimes
   ☐ No, not much
   ☐ No, not at all

6. Things have been getting on top of me
   ☐ Yes, most of the time I haven’t been able to cope at all
   ☐ Yes, sometimes I haven’t been coping as well as usual
   ☐ No, most of the time I have coped quite well
   ☐ No, I have been coping as well as ever

7. I have been so unhappy that I have had difficulty sleeping
   ☐ Yes, most of the time
   ☐ Yes, sometimes
   ☐ Not very often
   ☐ No, not at all

8. I have felt sad or miserable
   ☐ Yes, most of the time
   ☐ Yes, quite often
   ☐ Not very often
   ☐ No, not at all

9. I have been so unhappy that I have been crying
   ☐ Yes, most of the time
   ☐ Yes, quite often
   ☐ Only occasionally
   ☐ No, never

10. The thought of harming myself has occurred to me
    ☐ Yes, quite often
    ☐ Sometimes
    ☐ Hardly ever
    ☐ Never

Edinburgh Postnatal Depression Scale\(^1\) (EPDS)

Postpartum depression is the most common complication of childbearing.\(^2\) The 10-question Edinburgh Postnatal Depression Scale (EPDS) is a valuable and efficient way of identifying patients at risk for "perinatal" depression. The EPDS is easy to administer and has proven to be an effective screening tool.

 Mothers who score above 13 are likely to be suffering from a depressive illness of varying severity. The EPDS score should not override clinical judgment. A careful clinical assessment should be carried out to confirm the diagnosis. The scale indicates how the mother has felt during the previous week. In doubtful cases it may be useful to repeat the tool after 2 weeks. The scale will not detect mothers with anxiety neuroses, phobias or personality disorders.

Women with postpartum depression need not feel alone. They may find useful information on the web sites of the National Women’s Health Information Center <www.4women.gov> and from groups such as Postpartum Support International <www.chss.iup.edu/postpartum> and Depression after Delivery <www.depressionafterdelivery.com>.

<tbody>
<tr>
<td>QUESTIONS 1, 2, &amp; 4 (without an *)</td>
</tr>
<tr>
<td>Are scored 0, 1, 2 or 3 with top box scored as 0 and the bottom box scored as 3.</td>
</tr>
</tbody>
</table>

| QUESTIONS 3, 5-10 (marked with an *) |
| Are reverse scored, with the top box scored as a 3 and the bottom box scored as 0. |

| Maximum score: | 30 |
| Possible Depression: | 10 or greater |
| Always look at item 10 (suicidal thoughts) |

Users may reproduce the scale without further permission, providing they respect copyright by quoting the names of the authors, the title, and the source of the paper in all reproduced copies.

Instructions for using the Edinburgh Postnatal Depression Scale:

1. The mother is asked to check the response that comes closest to how she has been feeling in the previous 7 days.

2. All the items must be completed.

3. Care should be taken to avoid the possibility of the mother discussing her answers with others. (Answers come from the mother or pregnant woman.)

4. The mother should complete the scale herself, unless she has limited English or has difficulty with reading.

Postpartum Depression Screening Algorithm for Pediatric Providers During Well-Child Visits (with suggested talking points)

Parent completes the SWYC with EPDS screen during the following well child visits and during other visits as indicated:
- Within first month
- 2 month visit
- 4 month visit
- 6 month visit

If first screen for depression
Clinical support staff explains screen
Emotional complications are very common during pregnancy and or after birth. 1 in 8 women experience depression, anxiety or frightening thoughts during this time. It is important that we screen for depression because it is twice as common as diabetes and it often happens for the first time during pregnancy or after birth. It can also impact you and your baby’s health. Dads can also experience depression or anxiety before or after the baby is born. We will be seeing you and your baby a lot over the next few months/years and want to support you.

Give SWYC screen (with EPDS) to parent to complete in the waiting room or in a private exam room.

Score does not suggest depression
Clinical support staff educates parent about the importance of emotional wellness:
From the screen, it seems like you are doing well. Having a baby is always challenging and every parent deserves support. Do you have any concerns that you would like to talk to us about?

Provide information about community resources (e.g., support groups, MCPAP for Moms website) to support emotional wellness.

Suggests parent may be at risk of self-harm or suicide
It sounds like you are having a lot of strong feelings. It is common for parents to experience these kinds of feelings. Many effective support options are available. I would like to talk to you about how you have been feeling recently.

Do NOT leave parent/baby in room alone until further assessment or treatment plan is established. Immediately assess further:
1. In the past two weeks, how often have you thought of hurting yourself?
2. Have you ever attempted to hurt yourself in the past?
3. Have you thought about how you could harm yourself?
If concerned about the safety of parent/baby: You and your baby deserve for you to feel well. Let’s talk about ways that we can support you.
If there is a clinical question, call MCPAP regional hub. For safety concerns, refer to emergency services. Document in medical record.

If subsequent screen for depression
Parent completes the SWYC (with EPDS). See primer for other screening tools.

EPDS < 10
Score suggests depression
You may be having a difficult time or be depressed. What things are you most concerned about? Getting help is the best thing you can do for you and your baby. It can also help you cope with the stressful things in your life (give examples). You may not be able to change your situation right now; you can change how you cope with it. Many effective support options are available.

If positive score on self-harm question
1. If parent is already in mental health treatment or has previous provider, refer to/notify* parent’s provider.
2. If parent seems ok to follow through:
   - You may call MCPAP for Moms care coordinator for community resource (know mom’s insurance).
   - Give parent community resource information (e.g., MCPAP for Moms card and website).
   - Refer to/notify* parent’s PCP and/or OB/GYN for monitoring and follow-up.
3. If the parent does not meet any of above criteria or if you are concerned about safety, call MCPAP for Moms for consultation.
4. Engage natural supports* and encourage parent to utilize them.
   *Obtain parent’s consent

For all positive screens
Provider steps for positive screens

EPDS ≥ 10

If there are clinical questions (including questions about medications that may be taken during lactation), call MCPAP for Moms.
Postpartum Depression Screening Algorithm for Pediatric Providers During Well-Child Visits

If first screen for depression

Clinical support staff explains screen

Give SWYC (with EPDS) to the parent to complete in the waiting room or in a private exam room.

Score does not suggest depression

Clinical support staff educates parent about the importance of emotional wellness.

Provide information about community resources (e.g., support groups, MCPAP for Moms website) to support emotional wellness.

Suggests parent may be at risk of self-harm or suicide

Do NOT leave parent/baby in room alone until further assessment or treatment plan has been established. Immediately assess further.

If there is a clinical question, provider calls MCPAP regional hub. For safety concerns, refer to emergency services. Document the assessment and plan in medical record.

If subsequent screen for depression

Parent completes the SWYC (with EPDS). See primer for other screening tools.

EPDS<10

Score does not suggest depression

Clinical support staff educates parent about the importance of emotional wellness.

Provide information about community resources (e.g., support groups, MCPAP for Moms website) to support emotional wellness.

EPDS ≥ 10

If positive score on self-harm question

Score suggests depression

Provider steps for positive screens

1. If the parent is already in mental health treatment or has a previous provider, refer to/notify* parent’s provider.
2. If parent seems ok to follow through:
   • You may call the MCPAP for Moms care coordinator for community resource (know mom’s insurance).
   • Give the parent community resource information (e.g., MCPAP for Moms card, and website).
   • Refer to/notify* the parent’s PCP and/or OB/GYN for monitoring and follow-up.
3. If the parent does not meet any of above criteria or if you are concerned about safety, call MCPAP for Moms for consultation.
4. Engage natural supports* and encourage parent to utilize them.

*Obtain parent’s consent

For all positive screens

Provider documents clinical plan based on screening results. Not required to include screen as part of the medical record.

If there are clinical questions (including questions about medications that may be taken during lactation), call MCPAP for Moms.
